Project Reviewed: *Hybrid Cloud Infrastructure Proposal for Auto Rehab Global Services Limited*

Author: Imabong Mirabel Joseph Iseh

Project Summary

This project presents a refined Hybrid Cloud Infrastructure Proposal designed to improve the security, scalability, reliability, and cost-effectiveness of Auto Rehab Global Services Limited's IT environment. The author revisited the original proposal to address technical and business challenges while incorporating ethical considerations related to data privacy, cybersecurity, and professional responsibility. The refinements include stronger security controls, improved disaster recovery, enhanced monitoring, and better scalability planning.

Assessment of Technical Skills

The author demonstrates a solid understanding of cloud infrastructure principles and enterprise security practices. The implementation of Multi-Factor Authentication (MFA), Role-Based Access Control (RBAC), encryption for data at rest and in transit, Microsoft Defender for Cloud, automated backups, disaster recovery planning, load balancing, and cloud monitoring reflects appropriate technical knowledge for designing a secure hybrid cloud solution. These enhancements significantly improve the original proposal by addressing reliability, business continuity, and future scalability.

Evaluation of Ethical Integration

The project effectively integrates ethical considerations into the technical design. The discussion emphasizes protecting customer privacy through encryption and secure access controls while highlighting the professional responsibility of cloud engineers to design reliable and secure systems. The inclusion of backup and disaster recovery planning demonstrates accountability for maintaining service availability and protecting organizational data. The emphasis on professional integrity by recommending industry best practices over cost-driven decisions further strengthens the ethical foundation of the proposal.

Strengths

- The project is logically organized and easy to follow.
- Technical improvements directly address the identified weaknesses in the original proposal.
- Ethical considerations are clearly connected to the technical enhancements rather than discussed separately.
- The reflection demonstrates personal and professional growth throughout the course and reinforces the importance of ethical decision-making in cloud engineering.

Constructive Feedback

The proposal could be strengthened by providing more implementation-specific details. For example, identifying the intended cloud platform (such as Microsoft Azure or AWS), explaining how Microsoft Defender for Cloud would be configured, or including measurable objectives such as Recovery Time Objective (RTO), Recovery Point Objective (RPO), or expected system availability would make the proposal more practical. Additionally, including a simple hybrid cloud architecture diagram or implementation timeline would improve visualization and help readers better understand the proposed infrastructure.

Overall Evaluation

This is a well-developed project that successfully demonstrates both technical competence and ethical awareness. The refinements significantly improve the original proposal by enhancing security, scalability, monitoring, and disaster recovery while maintaining a strong focus on protecting customer information and acting with professional integrity. With additional implementation details and supporting architecture diagrams, this proposal would be even stronger. Overall, the project meets the assignment objectives and reflects the author's growth in cloud infrastructure design and ethical systems engineering.
